About the Procedure: A Brief Overview

Dear ASIIN Team,

Thank you for giving us the opportunity to participate in the International ASIIN Programme Accreditation, and we are pleased to summit the Self-Assessment Report for an International ASIIN Program Accreditation for the Bachelor's Degree in Computer Science and Technology. A brief overview of our School, and Programme is introduced as follows:

Taizhou University is located in Taizhou City, Jiangsu Province, with 13 secondary colleges and 37 undergraduate programmes. There are more than 800 full-time teachers and more than 13,500 students. The school adheres to the orientation of application-oriented education, strives to cultivate high-quality application-oriented talents, further promotes the integration of production and education, and actively serves the regional economic and social development. The overall level of the school and social influence continue to improve. Detailed introduction about Taizhou University can be seen in the website https://www.tzu.edu.cn/8/list.htm. The university is currently implementing the "14th Five-Year Development Plan of Taizhou University". For detailed information, please refer to **Appendix V(Appendix 04 University Development Plan)**.

The College of Information Engineering of Taizhou University was founded in 2014. It has four undergraduate programmes: Computer Science and Technology, Internet of Things Engineering, Data Science and Big Data Technology and Cyberspace Security. Adhering to the characteristics of application-oriented talent training, the college has always tracked the high-tech of the information and communication technology industry, and strives to cultivate application-oriented technology undergraduate talents who "apply what they learn". For more information about the College of Information Engineering of Taizhou University, please visit the following website: https://jsj.tzu.edu.cn/.

The Department of Computer Science and Technology offers the Programme of Computer Science and Technology, which has been approved and accredited by the Ministry of Education of China. For details, please refer to Appendix Y(Appendix 06 Official Programme Name). The programme of Computer Science and Technology first enrolled students in 2015, and was

approved as the first-class undergraduate professional construction project of Taizhou University in 2019. In 2022, it was approved as Jiangsu Province University international cultivation brand professional construction project, and at the same year, it was approved as Jiangsu Province first-class undergraduate professional construction project. In 2023, it was approved as Jiangsu Province Outstanding Engineers Education and Training Program 2.0 professional construction project.

The curriculum is divided into 8 modules: Module1: Basic Disciplinary Courses, Module2: Specialized Courses, Module3: General Courses, Module4: Integrated Practical Teaching, Main courses include: C Programming, Discrete Mathematics, Computer Organization, Data Structures, Database Principles and Applications, Design and Analysis of Algorithms, Operating Systems, Computer Networks, Software Engineering, Artificial Intelligence. Graduates of this programme will have acquired a solid foundation in mathematics, natural sciences, core theoretical knowledge, and professional skills related to computer science and technology. They will possess basic competencies in listening, speaking, reading, and writing in a foreign language, and be capable of working both independently and collaboratively in multidisciplinary teams. In addition, graduates will demonstrate literacy in the humanities and social sciences, along with a strong sense of social responsibility. They will be well-prepared to undertake roles in system analysis, design, development, and testing within the IT industry, research institutions, enterprises, and public organizations, with the potential to grow into key technical contributors or project coordinators.

We have prepared the SAR of the programme according to the general ASIIN Criteria and the Subject-Specific Criteria (SSC) of TC04. We believe that participation in this accreditation programme will significantly improve the quality and reputation of the programme.

Kind regards,

Department of Computer Science and Technology

ASIIN-Assessment Report for an International ASSIIN

Program Accreditation

for the Bachelor Degree of Computer Science and Technology

Section A of the SAR includes tables in which basic data concerning the accreditation procedure.

Section B contains basic data concerning the submitted study programmes.

Section C contains the Self-Assessment section, organised according to the ASIIN Criteria.

A About the Accreditation Procedure

General Data

Faculty/Department offering the Degree Programme	**Department of Computer Science and Technology**

Seals applied for

Name of the degree programme (in original language)	**(Official) English translation of the name**	**Labels applied for**	**Previous accreditation (issuing agency, validity)**	**Involved Technical Committees (TC)** (will be completed by ASIIN)
计算机科学与技术	Computer Science and Technology	ASIIN -Seal	/	TC 04

B Characteristics of the Degree Programme(s)

Name	Final degree (original/English translation)	Areas of Specialization	Corresponding level of the EQF	Mode of Study	Double/Joint Degree	Duration	Credit points/unit	First time of offer
Computer Science and Technology	工学学士/ B. Eng	Information and Communication Technology	6	Full time	/	8 semesters	212 ECTS	Sep. 01, 2015

Name	Intake rhythm	Intake Capacity per cohort	Average starting cohort size	Average number of graduates per cohort	Average time required to complete studies
Computer Science and Technology	Fall semester	Max. 172 students	169 students	53 students	4 years

C Self-assessment for the ASIIN-Seal

1. The Degree Programme: Concept, Content & Implementation

1.1 Objectives and learning outcomes of a degree programme (intended qualifications profile)

1.1.1 Objectives

The programme of Computer Science and Technology adheres to the fundamental task of moral education, aligns with the needs of regional economic and social development, and aims to cultivate students with sound personality and a strong sense of social responsibility. It promotes the all-round development of morality, intelligence, physical fitness, aesthetic appreciation, and practical abilities. Students are expected to master professional knowledge, possess the ability to solve engineering problems in the field of computer science and technology, and develop practical skills to engage in project design, software development, system operation, technical services, and management in areas such as the IT industry, research institutes, enterprises, and public institutions.

After four years of study, graduates will possess solid theoretical knowledge of mathematics, natural sciences, and computer science, including core areas such as programming, data structures and algorithms, computer networks, operating systems, databases, software engineering, and artificial intelligence, and will be able to propose effective solutions to complex engineering problems in computer applications while considering environmental, safety, and sustainable development factors. They will demonstrate strong engineering practice ability, teamwork and engineering management skills, as well as effective communication competence, enabling them to undertake roles such as software engineers or system developers and to grow into technical backbones or project managers in IT industries, research institutions, enterprises, and public organizations. In addition, graduates will possess good scientific and cultural literacy, sound moral character, and physical and mental well-being, with a strong sense of social responsibility and engineering ethics, as well as basic knowledge of economics, management, and relevant laws and regulations. Furthermore, they will exhibit innovative awareness and lifelong learning ability, be capable of continuously updating their knowledge and skills, and have an international perspective with cross-cultural communication and collaboration abilities, enabling them to adapt to technological advancement and social development.

1.1.2 Progrmme learning outcomes

The learning outcomes of the programme are divided into the following 11 parts:

(1) Engineering Knowledge

Ability to apply knowledge of mathematics, natural sciences, computing, engineering fundamentals, and computer science to solve complex engineering problems in the field of computer applications.

- Be able to possess and apply the necessary knowledge of natural sciences, mathematics, and computational science required to solve complex engineering problems; be able to select appropriate mathematical models to describe computer application systems, and be able to analyze, compare, and evaluate these models;
- Be able to possess the relevant engineering fundamental knowledge required for the development of computer application systems; be able to apply basic theories of computer science to solve complex engineering problems arising in the design and development of computer application systems.

(2) Problem Analysis

Ability to apply fundamental principles of mathematics, natural sciences, and engineering sciences to identify, formulate, and analyze complex engineering problems in the field of computer application systems through literature research, while taking into account the requirements of sustainable development, and to evaluate their rationality and obtain effective conclusions.

- Be able to apply mathematics, natural sciences, engineering fundamentals, and computer science theories and technical methods to identify and formulate complex engineering problems in the field of computer applications.
- Be able to analyze complex computer application systems, processes, or problems through the study of relevant literature to seek appropriate solutions, while comprehensively considering the requirements of sustainable development, in order to meet application needs or achieve improvements.

(3) Design/Development of Solutions

Ability to design specific solutions to complex engineering problems in computer application systems, such as intelligent application systems, big data analytics systems, and mobile application systems; to demonstrate innovation in the design process; and to consider feasibility from the perspectives of health and safety, life-cycle cost and net-zero carbon requirements, as well as legal, ethical, social, and cultural factors.

- Be able to determine specific solutions based on the requirements or design objectives of intelligent application systems, big data analytics systems, and mobile application systems, and be able to consider feasibility from the perspectives of health and safety, life-cycle cost and net-zero carbon requirements, as well as legal, ethical, social, and cultural factors.
- Be able to demonstrate innovation in the design process and to solve complex problems in an innovative manner.

(4) Research

Ability to conduct research on complex engineering problems in computer application systems based on scientific theories and methods, including selecting appropriate research approaches, designing experiments, analyzing experimental data, and drawing reasonable and effective conclusions through information synthesis.

- Be able to select appropriate research approaches and design feasible experimental schemes for complex engineering problems in computer application systems based on computer science theories and methods.
- Be able to analyze and interpret experimental results scientifically for complex engineering problems in computer application systems by integrating professional theories and practical experience, and be able to draw reasonable and effective conclusions through information synthesis.

(5) Use of Modern Tools

Ability to select and use appropriate modern engineering and information technology tools in the design and development of computer hardware and software, as well as in system analysis and design, to solve complex engineering problems in computer application practice, and to understand their limitations.

- Be able to master the main methods for acquiring professional literature and information in computer science, and be able to use modern information technologies for literature retrieval and information search.
- Be able to use common modeling tools, design tools, development tools, and testing tools to solve complex engineering problems in computer application systems, and be able to understand their working principles and limitations.

(6) Engineering and Sustainable Development

Ability to analyze and evaluate the impacts of engineering practice on health, safety, environment, legal, economic, and social sustainable development when solving complex

engineering problems in the field of computer applications, based on relevant engineering background knowledge, and to understand the associated responsibilities.

- Be able to be familiar with relevant technical standards, intellectual property, industrial policies, and laws and regulations in the IT industry.
- Be able to possess experience in engineering practice and understand the relevant background knowledge of computer engineering; be able to correctly recognize the impacts of computer engineering practice and solutions to complex engineering problems in application domains on health, safety, environment, legal, economic, and social sustainable development, and be able to understand the associated responsibilities.

(7) Engineering Ethics and Professional Conduct

Possess a sense of serving the country through engineering and benefiting society, with humanities and social science literacy and a strong sense of social responsibility; be able to understand and practice engineering ethics, comply with professional codes of conduct and relevant laws in computer engineering practice, and fulfill responsibilities.

- Be able to establish a correct worldview, outlook on life, and values; be able to continuously improve personal humanities and social science literacy, and maintain physical and mental well-being.
- Be able to adhere to engineering ethics, comply with professional codes of conduct and relevant laws in computer engineering practice, and fulfill social responsibilities.

(8) Individual and Teamwork

Possess team spirit and be able to undertake roles as an individual contributor, team member, and leader in teams with diverse and multidisciplinary backgrounds.

- Be able to understand the roles and responsibilities of each member within a diverse and multidisciplinary team, and be able to competently fulfill assigned individual roles.
- Be able to communicate effectively with other team members in diverse and multidisciplinary settings, listen to and integrate others' opinions and suggestions, and make reasonable decisions.

(9) Communication

Ability to communicate effectively with industry peers and the public on complex engineering problems in the field of computer applications, including writing reports, delivering presentations, expressing ideas clearly, and responding to instructions; and ability to communicate in cross-cultural contexts with an understanding of and respect for linguistic and cultural differences.

- Be able to read and write technical documents, deliver presentations, express ideas clearly, and respond to instructions; be able to communicate effectively with industry peers and clients,

and systematically and logically articulate complex engineering problems in the field of computer applications.

- Be able to understand and respect cultural diversity and differences, possess cross-cultural communication skills in both oral and written forms, and be able to communicate on professional issues in computer science and technology in cross-cultural contexts.

(10) Project Management

Ability to apply management principles and economic decision-making methods related to engineering projects to complex engineering problems in the multidisciplinary field of computer engineering.

- Be able to master the knowledge, principles, and methods of project management and economic decision-making related to the field of computer engineering.
- Be able to apply engineering management principles and economic decision-making methods to the design, operation, and management of application systems in multidisciplinary environments.

(11) Lifelong Learning

Possess the awareness and ability for self-directed learning, lifelong learning, and critical thinking; be able to understand the impact of broad technological changes on engineering and society, and adapt to the development of next-generation information technologies.

- Be able to recognize the impact of the rapid development of computer technology on society, be aware of the necessity of self-exploration and lifelong learning, and possess the ability for self-directed learning.
- Be able to understand major advances and frontier developments in computer science and technology, comprehend the impact of technological changes on engineering and society, and adapt to the evolution of next-generation information technologies.

Students majoring in Computer Science and Technology are expected to acquire the ability to apply professional knowledge in the fields of mathematics, natural sciences, Information and Communication Technology, independent learning, international communication, humanistic literacy and teamwork. The cultivation objectives in Part 1.1.1 and the eleven learning outcomes in Part 1.1.2 are summarized according to the cultivation plan of this programme. Please refer to **Appendix A (Appendix 01 Student Handbook)** for the cultivation plan for this programme.

1.1.3 Objectives-Module Matrix

To ensure the effective implementation of outcome-based education (OBE), the programme establishes a structured alignment framework linking Programme Educational Objectives (PEOs),

Programme Learning Outcomes (PLOs), and curriculum modules through three interconnected matrices. All three matrices are provided in **Appendix 07 Objective – Module Matrix**.

First, a Support Matrix of Programme Learning Outcomes (PLOs) to Programme Educational Objectives (PEOs) is developed to describe how each PLO contributes to the achievement of the long-term educational objectives. This matrix reflects a many-to-many relationship, ensuring that each PEO is supported by multiple PLOs and that the programme comprehensively addresses knowledge, engineering competence, professional ethics, and lifelong learning.

Second, an Objective – Module Matrix is constructed to align the Programme Learning Outcomes (PLOs) with the competence areas defined in the ASIIN Subject-Specific Criteria (SSC04), and to map them to corresponding curriculum modules. This matrix establishes a clear linkage between the six SSC04 competence areas, the eleven PLOs, and representative courses, ensuring that the curriculum systematically supports the development of formal, technological, methodological, interdisciplinary, and social competencies.

Third, a Support Matrix of Courses (Teaching Components) to Programme Learning Outcomes (PLOs) is developed to connect curriculum implementation with outcome achievement. In this matrix, all courses and practical teaching components are mapped to specific PLO indicators. A quantitative weighting scheme is adopted to represent the level of contribution of each course to each indicator. Qualitative support levels are transformed into numerical values and normalized within each PLO indicator, such that the total contribution of all courses to each indicator equals one. This ensures that the relative importance of courses is explicitly reflected, core courses receive higher weights, and the contribution structure remains balanced and interpretable.

Together, these three matrices establish a complete and traceable alignment chain:

- the PLO – PEO Support Matrix ensures that Programme Learning Outcomes support Programme Educational Objectives;
- the Objective – Module Matrix ensures alignment with the ASIIN SSC04 competence framework;
- the weighted Course – PLO Support Matrix ensures that curriculum components quantitatively realize the intended learning outcomes.

In addition, a comparison between the SSC04 competence framework and the programme’s PLO system shows that SSC04 defines six high-level competence domains, while the programme specifies eleven PLOs as a more detailed and operationalized outcome system. The SSC04 competences are systematically decomposed into assessable PLOs, and further refined according

to engineering education requirements and local needs (e.g., sustainability, project management, and lifelong learning). All SSC04 competence areas are fully covered without omission, and the finer granularity of PLOs enables precise curriculum mapping, quantitative evaluation, and continuous improvement.

This hierarchical and quantitative alignment enhances transparency and traceability between objectives, outcomes, and curriculum delivery, and provides a solid foundation for continuous improvement.

1.1.4 Process of formulating and revising the cultivation plan

The cultivation plan is the top-level design and guiding document for higher education institutions to achieve their talent development goals, reflecting the university's educational philosophy, orientation, and development strategy. The specific goals, learning outcomes, and curriculum system are clearly defined in the cultivation plan. Taizhou University has formulated the "Guidelines of Taizhou University on Revising the 2022 Undergraduate Programme of Talent Training" (see **Appendix F (Appendix 02 Quality Management Handbook) Page 13**), which provides the institutional framework for the formulation and revision of the cultivation plan. A dedicated cultivation plan formulation (revision) team, consisting of the Department Chair, academic leaders, and core faculty members, is responsible for organizing discussions and conducting research on talent development. During the revision process, extensive stakeholder consultation is carried out. Feedback is collected from graduates, employers, and industry representatives to understand the evolving requirements of regional economic development and social needs. Educational and research outcomes are also integrated into the continuous improvement of the cultivation plan. In addition, experts from other universities and industry professionals are invited to review the curriculum structure, including the logical sequence of courses and the rationality of the curriculum system. The cultivation plan is first approved at the school level, then reviewed by the Office of Academic Affairs, and finally implemented after deliberation by the Academic Committee. While maintaining overall stability, the cultivation plan is periodically revised to continuously optimize the curriculum system and improve the quality of talent cultivation.

To further demonstrate the actual implementation of this process, supporting working documents generated during previous revision processes have been provided in **Appendix E(Appendix 08 Study Plan or Curricular Overview)**. These materials include records of stakeholder consultations, questionnaire instruments, and related evidence from curriculum evaluation

activities, which illustrate how feedback is collected and used to inform the revision of the cultivation plan. At the same time, the programme regularly tracks graduates and collects feedback on the cultivation objectives and learning outcomes through questionnaire surveys. A comprehensive analysis of graduate outcomes is conducted to support continuous improvement. For details of the questionnaire survey, please refer to **Appendix B (Appendix 02 Quality Management Handbook)**. The results show that most graduates are employed in Jiangsu and surrounding regions, mainly as technical and managerial professionals, and employers have generally provided positive feedback on their overall performance. The cultivation plan has been continuously improved based on the above processes and evidence. The latest version of the cultivation plan can be found in **Appendix A (Appendix 01 Student Handbook)**.

1.2 Name of the degree programme

The name of this programme is Computer Science and Technology (See **Appendix Q (Appendix 21 Graduation Certificates) and Appendix R (Appendix 21 Graduation Certificates), including a sample of the diploma, academic transcript, and diploma supplement**). **In 1989, the Programme of Computer Science and Technology was officially enlisted in the "Undergraduate Programme Catalog for Regular Higher Education Institutions".** Computer Science and Technology is an undergraduate Programme offered in ordinary higher education institutions, falling under the category of information and communication technology. The basic length of study is four years, and the graduates are granted Bachelor Degree in Engineering.

The programme of Computer Science and Technology first enrolled students in 2015, and was approved as the first-class undergraduate professional construction project of Taizhou University in 2019. In 2022, it was approved as Jiangsu Province University international cultivation brand professional construction project, and at the same year, it was approved as Jiangsu Province first-class undergraduate professional construction project. In 2023, it was approved as Jiangsu Province Outstanding Engineers Education and Training Program 2.0 professional construction project. Since its inception, the programme has consistently been named "Computer Science and Technology". **This programme focuses on providing a solid theoretical foundation in computer systems, including both hardware and software, with computing theory, algorithm design, and system architecture as its core components. It integrates cutting-edge fields such as software engineering, artificial intelligence, network technology, and information security, and is committed to solving complex computational problems, building efficient and reliable information systems, and promoting innovation in intelligent applications. The programme**

name, Computer Science and Technology, directly reflects its dual focus and core connotations: Science emphasizes a deep understanding and exploration of the fundamentals of computing, algorithmic logic, and system principles, while Technology highlights the ability to translate scientific knowledge into practical systems, software tools, and application-level solutions.

1.3 Curriculum

The curricular overview, including the student workload for each semester, is provided in **Appendix C(Appendix 08 Study Plan or Curricular Overview)**. The syllabus for each course is presented in **Appendix D(Appendix 09 Module Descriptions)**.

In order to enhance the quality of professional cultivation, ensure students graduate within the prescribed timeframe, and support the attainment of the intended learning outcomes, the programme has established a periodic curriculum review mechanism in accordance with the principles of “student-centered”, “outcome-based”, and “continuous improvement”. The curriculum is reviewed on a regular annual basis, with more comprehensive revisions conducted every few years, as detailed in **Appendix E(Appendix 08 Study Plan or Curricular Overview) and Appendix X(Appendix 22 Student Surveys and Results)**. The review process involves multiple stakeholders, including experts from the Teaching Quality Evaluation Center, administrative staff from the Office of Academic Affairs, full-time faculty members, and external experts. In the most recent evaluation, 20 experts participated, including 15 internal experts (comprising experts from the Teaching Quality Evaluation Center, administrative staff from the Office of Academic Affairs, and full-time faculty members) and 5 external experts (including industry professionals and academic peers from other universities), together with 128 undergraduate students from different cohorts.

The evaluation is based on various sources of evidence, such as student feedback, teaching evaluation results, course performance data, and graduate development information. The rationality of the curriculum system is also assessed through dedicated surveys, as detailed in **Appendix E(Appendix 08 Study Plan or Curricular Overview)**. The results indicate a high level of overall satisfaction with the curriculum. The expert evaluation achieved an average score of 98.3, while the student survey reported an average satisfaction score of 92.6, with over 85% of students rating the curriculum as “good” or above. A more detailed analysis shows that students particularly value the logical structure and progression of the curriculum, as well as the solid foundation provided by mathematics and core computing courses. More than 88% of respondents agreed that the curriculum effectively supports the acquisition of fundamental knowledge and technical skills, and approximately 82% of students considered the course sequence to be well-arranged and conducive to learning. At the same time, both teachers and students identified several areas for improvement.

Approximately 35% of students suggested that the proportion of practical and project-based learning could be further increased, while about 30% of respondents expressed the need for more up-to-date content related to emerging technologies such as artificial intelligence and big data. In addition, some feedback pointed out that the connection between course content and real-world applications could be strengthened. The expert evaluation similarly emphasized the importance of enhancing practice-oriented training and improving alignment with industry development trends.

In response to these findings, the programme has formulated targeted improvement measures, including increasing the proportion of practical courses and course projects, promoting project-based and case-driven teaching methods, and introducing interdisciplinary elective courses aligned with local industry needs (e.g., AI-related applications in healthcare and data analysis). These measures will be implemented in subsequent curriculum revisions.

Through this process, the programme establishes a closed-loop mechanism of evaluation, feedback, and continuous improvement, ensuring that the curriculum is continuously optimized and effectively supports the attainment of programme learning outcomes.

To support the mobility of students between different programmes, Taizhou University has issued the "Taizhou College Full-time undergraduate students transfer to a full-time undergraduate program management measures (revised)", detailed in Appendix F (Appendix 02 Quality Management Handbook), Page 50. The document specifies the conditions and procedures for students to transfer programmes. Students transferring programmes can apply for credit substitution for similar courses already completed. In order to facilitate international exchange and cooperation, expand education for international students, and strengthen the standardized management of international student education, Taizhou University has issued the "Measures for the management of foreign students in Taizhou University", detailed in **Appendix F (Appendix 02 Quality Management Handbook), Page 105**.

With regard to this specific study programme, student mobility has been actively implemented in recent years in the forms of internal programme transfer, incoming international students, and outgoing international exchange and joint training programmes. Between 2021 and 2025, the programme recorded continuous student mobility, including regular internal transfers, the enrolment of international students from several countries, and the participation of students in international exchange and AI-related study programmes, such as those with City University of Macau and Macquarie University (Australia). A detailed statistical overview is provided in **Appendix 10 Statistics on Student Mobility**.

1.4 Admission requirements

According to the Provisions on the Admission Work of Ordinary Higher Education Institutions, Taizhou University fully implements the “Sunshine Project” for enrollment and adheres to the principles of openness, fairness, justice, comprehensive evaluation, and selective admission.

Statistics on admission for the Computer Science and Technology programme over the past five years are provided in **Appendix 12 Statistics on Admission Rate**. The data indicate that the number of applicants has remained generally stable, with a slight increase in recent years, reflecting sustained demand for the programme. Meanwhile, the number of admitted students is generally close to the number of available seats, resulting in consistently high admission rates. This demonstrates that the programme maintains a stable enrollment scale and a well-balanced admission mechanism. Minor discrepancies between available seats and admitted students are mainly due to factors such as major transfers, returning soldiers, and students repeating a year, which are common in Chinese higher education institutions.

In terms of academic performance, as shown in **Appendix 18 Statistics on Grade Distribution**, the majority of students achieve a final grade of “Fair” or above, with a considerable proportion reaching “Good” or “Excellent”, while the proportion of failing students remains very low. This indicates that admitted students possess an adequate academic foundation and are able to meet the programme’s academic requirements.

Furthermore, student progression and completion data, as presented in **Appendix 16 Statistics on Academic Success**, show that a high proportion of students graduate on time, while the number of delayed graduates and students still enrolled is relatively small. The dropout rate remains at a very low level. These results demonstrate that students progress smoothly through the programme and that the teaching and learning process is stable and effective.

Overall, the admission process of the programme is standardized and transparent, and the admission data demonstrate a stable intake, reasonable selectivity, and satisfactory student quality. Together with the observed academic performance and graduation outcomes, this forms a coherent “admission – education – graduation” cycle, which provides strong support for the achievement of the Programme Learning Outcomes (PLOs).

1.4.1 Enrollment Requirements

In order to ensure that students have sufficient prior knowledge before enrollment, those applying for undergraduate programme and bachelor's degrees must participate in the National

College Entrance Examination of the People's Republic of China or examinations organized by certain provinces and cities. Those meeting the following conditions are eligible to apply to Taizhou University:

1) Complying with the relevant regulations of the national and Jiangsu provincial education authorities regarding the admission of ordinary higher education institutions;

2) Holding a high school diploma or equivalent qualification;

3) Being in good physical health.

For detailed enrollment guidelines, please refer to **Appendix G (Appendix 11 Admission Regulation)**.

1.4.2 Enrollment Process

Taizhou University conducts its admissions work under the unified leadership of the Jiangsu Provincial Education Examination Institute. The Admissions and Employment Office is responsible for formulating enrollment plans, establishing admission criteria and procedures, verifying admission results, and handling related matters. To support these efforts, the university has established an Enrollment Promotion Workstation that organizes outreach activities in various provinces and assists with recruitment. During the admission phase, candidates are evaluated based on their moral character, academic performance, and physical health, with selection primarily determined by their results in the National College Entrance Examination (Gaokao) and their submitted program preferences. Candidates who meet the university‘s requirements—including ideological and political integrity, ethical conduct, legal compliance, and physical qualifications—may be admitted into appropriate programs. The admissions process is supervised by higher-level authorities and the university‘s internal supervision departments and is subject to public oversight. Newly admitted students must present their admission notices and required documents and complete the registration procedures within the specified timeframe.

It is important to note that, in accordance with the "Implementation Opinions of the State Council on Deepening the Reform of the Examination and Enrollment System", starting from January 1, 2015, national bonus points for sports expertise, participation in National Middle School Student Academic Olympiads and national competitions in science and technology have been abolished. Only a few qualified universities are allowed to conduct independent admissions, selecting outstanding students with subject expertise and innovative potential. Some of the students’ academic achievements outside universities are recognized by these universities.

1.5 Work load and credits

In the majority of Chinese higher education institutions, the calculation of student workload is based on contact hours, while in the European Credit Transfer and Accumulation System (ECTS), the calculation of student workload also includes self-study time. Therefore, the total student workload is defined as the sum of contact hours and self-study hours. Generally, 30 study hours (including both contact and self-study time) are equivalent to 1 ECTS credit. According to the ECTS workload and credit calculation standards, students in this programme must complete a total workload of 6360 hours, equivalent to 212 ECTS credits, over four academic years. All compulsory components of the programme are included in the workload calculation. Students earn credits for each course they successfully complete. Detailed information on course modules and corresponding workloads is provided in **Appendix A (Appendix 01 Student Handbook)**. The workload is designed to be relatively balanced across semesters, with an average of approximately 795 hours (26.5 ECTS credits) per semester, thereby avoiding structural overload in specific periods and supporting completion within the standard duration of study. Details of the courses offered each semester can be found in **Appendix C(Appendix 08 Study Plan or Curricular Overview)**.

To ensure that the assigned credits correspond to the actual student workload, the programme has established a regular monitoring and verification mechanism. The actual workload is evaluated each semester through multiple sources, including student workload surveys(see **Appendix H (Appendix 15 Conversion from Credit Points to ECTS Credits), Page 10**) and Appendix X(Appendix 22 Student Surveys and Results), teaching evaluations, and course feedback. Students are actively involved in this process by reporting their perceived workload for each course, including both contact hours and self-study time. The collected data are analyzed by the programme coordinators, together with the department chair and the academic secretary, to compare the planned workload with the actual workload experienced by students. If discrepancies or workload imbalances are identified, adjustments are made accordingly, such as modifying course content, redistributing workload, or optimizing course scheduling. All adjustments are documented and incorporated into subsequent curriculum revisions.

In addition to the credit recognition for course learning outlined in the cultivation plan, the university also awards credits for students' innovation and entrepreneurship achievements and participation in extracurricular activities. Specific credits are designated for innovation and entrepreneurship, as well as "the second classroom" activities. The university has established

relevant regulations to ensure the standardized recognition of such credits (see **Appendix H (Appendix 15 Conversion from Credit Points to ECTS Credits)**).

Through this process, the programme ensures that the workload allocation is realistic, well-founded, and continuously aligned with students' actual learning experience.

1.6 Didactics and Teaching Methodology

Professional courses are usually taught in small classes, typically with 40-50 students. Full-time teachers explore specific teaching methods for their respective courses. The main teaching methods include:

(1) Lecture

Key points and difficult points in the course content are primarily taught through lectures using a combination of slides and blackboards. This approach makes the course concrete, easy to understand, and engaging. The lecture process encourages student interaction, and teachers can actively assess students' learning through questioning.

(2) Case-based teaching

During the teaching process, practical cases are incorporated into instruction. These cases primarily originate from the real-world engineering experience of faculty members in the field of computer science and technology, as well as from their research achievements. Integrating such cases into theoretical courses, internships, and thesis supervision helps to stimulate students' interest and engagement.

(3) Blended online and offline teaching

Online resources allow students to learn and explore new course content independently in advance. Offline classroom teaching delves deeper into the course content and related knowledge. Through online teaching platforms, interactive elements are added to offline teaching. Some courses have online teaching resources such as instructional videos, slides, and other reference materials to facilitate students' self-learning.

(4) Integrated teaching of theory and practice

Teachers play an important role by setting teaching tasks and objectives, allowing both teachers and students to learn, teach, and practice simultaneously. A framework for cultivating skills and qualities is constructed throughout the entire process, enriching both classroom and practical teaching segments. This approach strengthens theoretical knowledge while enhancing students' innovation and practical abilities, thereby improving the quality of teaching.

(5) Project-based teaching

Using a task-driven teaching model, teachers create teaching scenarios for students to explore and discover new knowledge, while also emphasizing the cultivation of teamwork spirit. Group discussions, exchanges, and debates are encouraged during the learning process.

Based on the teaching methods outlined in the course syllabus, teachers implement practical teaching work and ensure that the chosen methods achieve the teaching objectives. In order to improve students' understanding of key points and their ability for independent learning, besides assigning practice exercises as homework, teachers often require students to complete comprehensive assignments. These assignments usually involve researching a specific topic and writing stage-based course papers or investigation reports. In some cases, teachers also adopt group presentations to allow students to give oral reports. Through these methods, students' abilities in literature retrieval, problem-solving, academic writing, data visualization, organization and coordination, PowerPoint presentation, and oral expression are developed. These skills are crucial for students' future academic pursuits or work.

Due to the wide range of knowledge and strong applicability in this programme, the jobs that students may engage in after graduation can vary greatly. Therefore, in the teaching process, teachers always emphasize the integration of theory and practice, and cultivate students' practical application abilities. The specific measures are as follows:

(1) In the teaching plan, practical experiments are included in some specialized courses. These experiments are primarily designed to connect theoretical teaching content and cultivate the ability to apply knowledge in practice. To meet the requirements of course experiments, the programme has established multiple teaching laboratories, with the main teaching laboratories detailed in **Appendix N (Appendix 03 Cooperation Agreement), Page 12**.

(2) In the cultivation plan, courses with a strong practical orientation—such as course projects and lab-based instruction—are included. Typically, under the guidance of instructors, students complete hands-on tasks such as software design and development, algorithm implementation, database modeling, and system testing. These activities aim to cultivate students’ innovative thinking, engineering practice abilities, and problem-solving skills in the field of computer science and technology.

(3) The cultivation plan incorporates off-campus internship opportunities. The programme actively promotes the integration of industry and education, establishing off-campus practical training bases in collaboration with enterprises. Agreements for co-building internship bases with enterprises have been signed, and students are organized to visit these enterprises or engage in production internships. This aims to enhance students' practical operational skills and increase

real-world production experience. The list of internship bases co-built through university-enterprise cooperation and the corresponding cooperation agreements can be found in **Appendix M (Appendix 03 Cooperation Agreement)**.

2. Exams: System, Concept & Organization

2.1 System

Students must pass rigorous course assessments, foreign language assessments, and bachelor's degree thesis assessments to obtain a bachelor's degree. **The assessment methods and content strictly adhere to the specific module's learning outcomes (Knowledge, Skills and Competence). The assessment results should reasonably reflect the students' acquired abilities and the achievement of learning objectives.** According to the " Implementation Rules for the Granting of Bachelor's Degree to Graduates of Regular Full-time Undergraduate Programs in Taizhou University (Revised)" (**Appendix F (Appendix 02 Quality Management Handbook), Page 45**), students in this Programme can be awarded a bachelor's degree under the following conditions:

(1) Within the prescribed period of study, Students must complete all courses specified in the cultivation plan, earn the required credits, and obtain a qualified score for the bachelor's degree thesis.

(2) Students must participate in the National College English Test Band 4 (CET-4), and the score should reach 390 points (on a 710-point scale). If a student's score in the CET-4 does not meet the specified requirements, they can take the English proficiency test organized by the university, and the score should be at least 60 points (on a 100-point scale).

Course assessments are a crucial component of teaching, examining not only students' mastery and application of knowledge but also the effectiveness of teaching by instructors. Details regarding course assessments are outlined in **Appendix F (Appendix 02 Quality Management Handbook), Page 57**. Foreign language assessments require students to take the National College English Test (CET-4) or the English proficiency test organized by Taizhou University. The provisions on foreign language assessments in the "Implementation Rules for the Granting of Bachelor's Degree to Graduates of Regular Full-time Undergraduate Programs in Taizhou University (Revised)" are detailed in **Appendix F (Appendix 02 Quality Management Handbook), Page 45**. **Bachelor's degree thesis assessments are a critical teaching element for the university to achieve its cultivation goals, representing a key part in cultivating students' scientific thinking, innovative and entrepreneurial abilities, and practical skills. The regulations concerning bachelor's degree theses can be found in the "Taizhou University graduation design (thesis)**

work management regulations (revised)" in Appendix F (Appendix 02 Quality Management Handbook), Page 81-97.

2.2 Concept

2.2.1 Course assessment

Course assessment is an important way to reflect the quality of teaching and the learning outcomes of students, as well as an important method to examine and analyze the effectiveness of teaching. According to the "Taizhou University Examination Work Implementation Rules (Revised)" (see **Appendix I (Appendix 17 Examination Regulations), Page 1**), students must participate in the course assessment specified in the cultivation plan.

Course assessment can be conducted in various forms such as written exams, computer operations, comprehensive assignments, and laboratory (internship) reports. **In order to facilitate students' exam preparation, each course syllabus clearly specifies the assessment methods. When choosing courses, students can access information on assessment methods, content, and other details. Course assessments strictly adhere to the cultivation plan and course outlines. In principle, closed-book exams are required for core courses, in accordance with the cultivation plan and course outlines.**

(1) Students who have attended the final exam of the course but fail to pass it can have one opportunity to take a make-up exam for this course. The make-up exam is generally scheduled at the beginning of the next semester after the course's final exam.

(2) Students who cannot attend the final exam due to special circumstances must submit a written application to the university before the exam. With approval, they can be allowed to defer the exam. Deferred students can take the corresponding course make-up exam organized by the university at the beginning of the next semester.

(3) Students who fail to take the deferred or make-up exam on time, or still fail the deferred or make-up exam, must retake the course. Students who were absent from the exam or had their exam qualification cancelled are generally not allowed to take the make-up exam, but they can register for course retake. Detailed information about the calculation method for retake grades can be found in Appendix I (Appendix 17 Examination Regulations), Page 13.

2.2.2 Curriculum assessment standard

The assessment of each course is designed to demonstrate the extent to which the intended learning outcomes are achieved. For each course, the assessment components are explicitly aligned with the defined course-level learning outcomes, which in turn support the programme learning outcomes (PLOs). The assessment results are recorded in the course archive materials in

the form of overall grades. The overall grade of a course is determined by a combination of continuous assessment and final examination. Continuous assessment evaluates students' ongoing performance and typically includes attendance, homework, classroom participation, periodic tests, laboratory work, and comprehensive assignments. The final examination mainly assesses students' understanding of key concepts and their ability to apply knowledge to solve problems.

In principle, continuous assessment accounts for 30% – 50% of the overall course grade, while the final examination accounts for 50% – 70%. Different assessment components are designed to evaluate different aspects of the intended learning outcomes. For example, assignments and projects focus on problem-solving and practical skills, while examinations focus on conceptual understanding and analytical ability. A total score of 60 is considered a pass and indicates that the student has achieved the minimum requirements of the intended learning outcomes for the course.

In order to comprehensively evaluate students' learning quality, credit points and grade points are used. Assessment results are generally calculated on a percentage scale. In some courses, a five-level grading system ("excellent", "good", "fair", "pass", "fail") is adopted. The conversion methods between assessment scores and grade points are shown in Table 2-1 and Table 2-2. For detailed information, please refer to **Appendix F (Appendix 02 Quality Management Handbook), Page 41-43**.

Furthermore, the achievement of learning outcomes is analyzed through course-level assessment data, including grade distribution, exam quality analysis, and learning outcome attainment evaluation, as provided in **Appendix I (Appendix 17 Examination Regulations), Page 11**. These results are used to support continuous improvement of teaching and assessment design.

Table 2-1 The conversion method of assessment results and grade points

Assessment scores	Grade points
90-100	4.0-5.0
80-89	3.0-3.9
70-79	2.0-2.9
60-69	1.0-1.9
<60	0

Table 2-2 The conversion method of five-level scale and grade points

Grade	Grade points
Excellent	4.5
Good	3.5

Fair	2.5
Pass	1.5
Fail	0

Course Credit Grade Point = Course Credits × Grade Point

The calculation method for average grade point is as follows:

Cumulative Grade Point Average = Σ (Credits of Required Courses × Grade Point) / Σ Credits of Required Courses

A credit system is adopted to comprehensively evaluate the courses studied by students. For a sample transcript of students in this programme, please refer to **Appendix K (Appendix 18 Statistics on Grade Distribution)**. Some statistical information about the grades of the students in this programme can be found in **Appendix J (Appendix 14 Workload Verification)**.

2.2.3 Foreign language assessment criteria

The National College English Test Band 4 (CET-4) is a standardized test sponsored by the Ministry of Education and administered by the National Education Testing Authority. It aims to promote college English teaching, measure college students' English ability objectively and accurately, and serve to improve the teaching quality of college English courses in China.

To obtain a bachelor's degree, students in this major must take the National College English Test Band 4 (CET-4) with a score of 390 points (out of 710 points). If the score does not meet the required requirements, students take the degree English test organized by the university with a score of 60 points (out of 100 points).

2.2.4 Bachelor’s Degree Thesis

The overall score of the Bachelor’s Degree Thesis is made up of the scores given by their instructor (covering 30%),the scores by an evaluator (covering 20%) and the scores by the Defense panel (covering 50%). The overall score of the Bachelor’s Degree Thesis adopts a five-level scale, excellent (90-100 points), good (80-89 points), fair (70-79 points), pass (60-69 points), fail (below 60 points). The excellent rate of the overall score of the Bachelor’s Degree Thesis is generally not more than 10%.

The conditions for recommending a bachelor's degree thesis with an "Excellent" level are as follows:

(1) The topic should be scientifically chosen, aligning with the requirements of the professional curriculum, and effectively demonstrating the comprehensive application of fundamental knowledge and skills in the field.

(2) It should possess a certain degree of innovation, academic level, insightful perspectives, practical value, or reference significance.

(3) The number of bachelor's degree theses recommended for the university-level Excellent Bachelor's Degree Thesis should be no more than 2% of the total theses for the academic year.

(4) The thesis recommended should receive an overall assessment on the score of "Excellent" in the university-level Excellent Bachelor's Degree Thesis evaluation.

2.2.5 Academic Integrity Code for Students

Students should complete assignments, experiments, exams, and bachelor's degree theses according to the requirements of the university and the teachers. Acts of dishonesty in assignments, experiments, exams, or bachelor's degree theses include:

- Failure to adhere to examination discipline, engaging in cheating, academic fraud, and other misconduct during exams.
- Violation of academic ethics by plagiarizing others' papers and other research achievements.
- Altering or copying others' assignments, experiment reports, or theses.
- Having someone else complete assignments, experiments (reports), or completing theses on others' behalf or substituting for others.
- Any other dishonest behavior not mentioned above.

Disciplinary actions, including warnings, severe warnings, demerit recording, disciplinary probation and expulsion, may be imposed based on the severity of the aforementioned dishonest behaviors.

2.3 Organisation

2.3.1 Organisation of Course Assessments

The assessment methods for each course are explicitly specified in the syllabus. Course assessments are typically scheduled at the end of each semester, allowing students sufficient time to prepare for exams. The exam questions are formulated by the relevant teaching and research office, with a question-setting group organised by the teaching and research office based on the syllabus. **Each course has both Exam Paper A and B, including standard answers and scoring rubrics.** The papers, after approval by the department chair and the dean of the school, are delivered to the Examination Paper Printing Center of the Academic Affairs Office two weeks prior to the exam.

The Printing Center registers and accepts the delivered exam papers, ensuring their clarity. Once printed, the papers are immediately sealed in bags, and any waste papers or printing materials generated during the printing process are promptly destroyed.

For every exam, invigilators are assigned. The main instructors must participate in the invigilation of the courses they teach and are responsible for promptly addressing any issues that arise during the exam. Invigilators must strictly fulfil their duties and adhere to the "Rules for Invigilation". For more detailed information, please refer to **Appendix I (Appendix 17 Examination Regulations), Page 3-6**.

The university has established an exam invigilation system. During exams, invigilators check the performance of other invigilators in fulfilling their duties, and together with invigilators, handle disciplinary matters. After each exam, invigilators must diligently complete the "Form for Inspection Record".

Teachers are responsible for evaluating exam papers rigorously, fairly and justly according to the established standards, and without adjusting the points arbitrarily. If any changes are made, the relevant teacher must sign at the modification location. Assessment scores are generally based on a percentage scale, while some courses may be evaluated using the five-grade system ("Excellent”, "Good”, “Fair”, "Pass", "Fail").

The instructor for each course is required to complete the grading within the prescribed time after the end of the exam, enter the results into the Teaching Management Information System, and submit the completed "Student Grade Registration Form" to the department. After the department chair's approval and signature, the grade registration form is sent to the Academic Affairs Office. For specific regulations, please refer to **Appendix I (Appendix 17 Examination Regulations), Page 6-9**.

Students can check their exam results online. If a student disputes the exam results, they can request a review. The applicant must submit the request to their school and after approval by the department chair, report it to the Academic Affairs Office, which organises personnel to conduct a review. Any errors discovered during the review must be corrected following relevant procedures.

The exam papers and other materials for exam courses are uniformly kept in the academic affairs office of the school for a period of five years.

2.3.2 Organistion of foreign language tests

Every June and December, the Academic Affairs Office of Taizhou University organises students in this programme to participate in the national College English Test Band 4 (CET-4). Those students who fail to meet the specified requirements made by the university in the national CET-4 have to participate in the English proficiency examination organised by the Academic Affairs Office during their senior year.

2.3.3 Organisation of the Bachelor's dissertation

The Academic Affairs Office formulates the overall progress of the Bachelor’s dissertation in the university, clarifying management objectives, decomposing tasks and making implementation plan. It also supervises the progress and quality of the theses at various stages in all the schools, coordinating and resolving related problems. Each school establishes a leadership team for the thesis work, making a detailed plan and implementation rules. The team guides supervisors to fill out the forms such as "Dissertation Proposal", "Tasks Assignment", "Mid-term Check on the Dissertation" "Supervisor’s Evaluation". It also guides students in writing the "Dissertation Proposal" and the Dissertations, regularly checks the progress and quality of the students' dissertations, and the materials archiving according to the requirements.

If a student wants to write his bachelor's degree thesis outside the university, he has to submit a written application and provide an acceptance letter from the other party, like from the internship unit. He cannot proceed until the school reviews his application and approves that. In addition, the student has to return to the university to defend his dissertation with those on-campus students.

"Taizhou University graduation design (thesis) work management regulations (revised)" (see Appendix F (Appendix 02 Quality Management Handbook), Page 84) makes clear regulations on such work as dissertation topic selection, plagiarism detection, defense and evaluation, random checks, excellent thesis evaluating and material archiving.

3. Resources

3.1 Staff and Staff Development

3.1.1 Staff

The College of Information Engineering has a teaching staff with high academic qualifications and strong teaching abilities.The college currently has 52 full-time teachers, including 5 professors, 1 industry professor, 16 associate professors, 20 doctors (including 6 overseas doctoral degree holders), 2 doctoral supervisors, 5 master's supervisors, and 2 outstanding young backbone teachers under the "Qinglan Project" of Jiangsu Province's colleges and universities. It has established outstanding teaching and research teams such as the Excellent Teaching Team for Computer Science and Technology, the Excellent Teaching Team for Computer Network Course Group, the Excellent Teaching Team for Python Programming, the Excellent Scientific and Technological Innovation Team for Big Data Intelligent Processing, and the excellent Teaching Team for Basic Computer Science Courses.

The Department of Computer Science and Technology currently has 16 full-time teachers, including 2 professors, 4 associate professors, and 10 lecturers. 50% of the teachers hold doctoral degrees. The teaching staff covers disciplines such as computer science and technology, software engineering, and information and communication engineering, which can meet the needs of professional course teaching. Professor Ren Xiangmin, as the professional head, has undertaken more than ten projects at the national, provincial and municipal levels. Presided over one national first-class course; As the first author or corresponding author, more than 50 academic papers have been published in domestic and international journals and conferences such as "Computer Applications". As the first author, I have published one monograph and over ten textbooks.

According to the enrollment and cultivation plan for students majoring in Computer Science and Technology, each teacher is required to undertake a teaching workload of 330 hours per year for undergraduate teaching. In addition to mandatory theoretical teaching, each teacher must give after-class guidance and grade assignments, ensuring that every student in this programme receives comprehensive guidance in relevant courses and extracurricular assignments. This also ensures that all the students can finish the required courses and acquire the specified skills, ultimately achieving the goals set by the cultivation plan. Including teachers of the Department of Computer Science and Technology, 46 teachers of the College of Information Engineering are involved in teaching professional courses. Furthermore, over 20 teachers from other schools of Taizhou University are involved in teaching teaching mathematics, physics, foreign languages, and other general courses for this programme. The resumes of the faculty participating in this programme can be found in Appendix L (Appendix 19 Staff Handbook).

For the programme, the school regularly evaluates and inspects whether the teachers in terms of their educational background and professional titles can meet the needs of professional teaching. It also formulates plans for teachers' further education and talent recruitment.

3.1.2 Staff Development

The university has an Academic Affairs Office/Center for Teaching and Learning Development, which is primarily responsible for teaching research, resource development, teaching evaluation, and faculty development. The Center conducts teaching quality assessment and diagnostics through teacher training, academic exchanges, evaluation, and pedagogical research. It provides systematic support to enhance teachers' instructional abilities, promote teaching reform and innovation, and continuously improve teaching quality. To strengthen the development of young teachers, the university organizes a one-week induction training for new teachers every year. In

addition, a mentorship mechanism is implemented, whereby each new teacher is assigned an experienced faculty mentor to provide guidance in both teaching and research activities.

To further promote faculty development, the university actively supports continuing education and professional training. Faculty members are encouraged to participate in domestic and international academic exchanges, visiting scholar programs, and various professional development activities to continuously update their knowledge and broaden their academic perspectives. In recent years, a number of teachers have engaged in international cooperation through joint research, academic visits, and participation in international conferences, thereby enhancing the global vision and academic influence of the teaching staff.

The university implements the "Qinglan Project" (Young Teacher Development Program), which aims to cultivate young and mid-career teachers through systematic training, teaching competitions, research support, and mentorship. This program has significantly improved the teaching competence and research capabilities of young faculty members.

In order to strengthen the practical teaching ability of faculty members, the university actively promotes the development of "dual-qualified teachers" (i.e., teachers with both academic qualifications and industry experience). According to the "Professional and Technical Qualification Standards for Teachers at Taizhou University" and the Implementation Guidelines on Enhancing Teachers' Professional Practice Competencies, candidates applying for a senior academic title must have either accumulated at least one year of work experience in an enterprise or institution prior to joining Taizhou University, or completed a minimum of six consecutive months of professional practice at the production front lines of an enterprise after their appointment. This professional practice must be closely aligned with the teacher's field of instruction and meet the requirements of applied undergraduate education, including participation in industry production or research activities, acquisition of relevant professional knowledge and technical skills, and completion of reflection reports or research summaries. These measures effectively promote the construction of a high-quality dual-qualified teaching team.

The university has signed strategic cooperation agreements with multiple departments of the local government and enterprises and has collaborated with various scientific research institutes to enhance its research capabilities and promote the integration of industry, academia, and research. Additionally, the university cooperates with enterprises in faculty training, joint cultivation, and the establishment of off-campus internship bases. The list of partner enterprises and cooperation agreements can be found in Appendix M(Appendix 03 Cooperation Agreement).

In recent years, the teaching staff in this programme has achieved numerous accomplishments in both teaching and research. Continuous efforts in teaching reform and scientific research have significantly improved the overall quality of the faculty and the effectiveness of talent cultivation. Details of provincial-level research projects, excellent courses, textbooks, monographs, and provincial- and ministerial-level awards obtained by the teaching staff can be found on Pages 4－7 in Appendix N(Appendix 03 Cooperation Agreement). Representative academic publications are provided in Appendix O(Appendix 19 Staff Handbook).

Furthermore, supporting documents related to international faculty cooperation, faculty training and continuing education, the implementation of the Qinglan Project, and the development of dual-qualified teachers are provided in Appendix W(Appendix 20 HR Plan)

3.2 Student Support and Student Services

To help students achieve their expected learning outcomes and successfully finish their study within the specified time, the following measures are implemented in this programme:

(1) Student Affairs Office

The Student Affairs Office formulates regulations and rules related to student affairs and supervises their implementation. It is in charge of daily ideological and political education of students and management service of students. Its specific responsibilities include:

- Formulating the "Classroom Management Measures in the College of Information Engineering" to maintain a normal teaching order and create a good academic and learning environment.
- Guiding and coordinating the work of full-time counselors and head teachers.
- Guiding and providing services for the Youth League, dormitory management, rewards and assistance, employment guidance (graduates' archives), career planning, psychological health education and counseling, scientific and technological innovation, campus cultural and sports activities, student clubs, publicity and the student union.

(2) System of full-time counselors for students

The school assigns a full-time counselor to serve and manage students during the four years of university. Based on the objective conditions, and the laws of ideological education and the contemporary college students' growth and development, the counselors carefully fulfill nine major duties, including: ideological education, value guidance; party and class construction, academic atmosphere building, daily affairs management and psychological health education and

counseling, campus crisis response, career planning and employment guidance, and theoretical and practical research.

(3) System of head teachers

Each class is assigned a head teacher, primarily responsible for serving and managing the class. The main responsibilities include: ideological education and guidance for the class; establishment of a good learning atmosphere in the class; guidance in academic planning and career planning; assistance in academically difficult students and concern for students' lives by visiting their dormitories.

(4) Career office

The function of the Career Office combines individual counseling, group coaching and teaching practice. It focuses on the fundamental tasks of fostering morality of talents, aiming to promote more high-quality employment for students. It provides professional, modular and standardized instruction and consultation for all the students at university by focusing on three dimensions: career planning, job-hunting skills enhancement (career positioning, information searching, job application materials, interview skills, job management) and advancement of thinking mode in the workplace. In the office there are full-time teachers and part-time career advisers, HR professionals from large enterprises, and outstanding alumni as mentors. It offers lectures, trainings, and group counseling sessions, and provides services for all the university students and faculty members. Please refer to **Page 9 in Appendix N (Appendix 03 Cooperation Agreement)** for the information about the lectures which have been given to students.

(5) Measures for programme transfer

In order to motivate students' initiative and give them greater autonomy and choice in their learning, Taizhou University allows students to transfer to another programme. According to the "Taizhou College Full-time undergraduate students transfer to a full-time undergraduate program management measures (revised)" (see **Appendix F (Appendix 02 Quality Management Handbook), Page 54**), a freshman can apply to transfer to another programme in the second semester, and a sophomore can also apply to transfer to another programme in the fourth semester.

(6) Course website

The professors in this programme actively engage in online teaching. There are dedicated webpages (https://tzsz.fanya.chaoxing.com/portal) for most courses on the online teaching platform of Taizhou University, offering students abundant resources to enhance their self-learning abilities. Students can find course-related information on the website and communicate

with their teachers online. During designated and agreed-upon time each week, professors are available in their offices to answer students' questions related to the courses.

3.3 Funds and equipment

3.3.1 Investments in the recent five years

The College of Information Engineering attaches great importance to the investment in the teaching funds and prioritizes allocation of the teaching funds in the annual budget to ensure sufficient funding for daily teaching activities. The university allocates funds for teaching expenses, teaching-related research expenses, and general teaching equipment maintenance expenses. The teaching funds for this programme are sufficient to meet the needs of daily teaching and projects. Over the past five years, the expenditure on teaching for this programme has exceeded 14.952 million yuan. For specific details, please refer to **Page 7 in Appendix N (Appendix 03 Cooperation Agreement)**.

3.3.2 Platforms of information resources for books

(1) The library, reference materials, and digital media information

The university library covers a total area of 36,700 square meters and houses a rich collection of resources. It contains over 1.26 million printed books, more than 1,755 types of Chinese and foreign periodicals, and over 1.41 million volumes of electronic books. In total, 27 Chinese and foreign databases are available, including China National Knowledge Infrastructure (CNKI), Wanfang Data Knowledge Service Platform, Chaoxing Duxiu Academic Search, and ProQuest Central (see Appendix N (Appendix 03 Cooperation Agreement), Page 8 for the full list).

The library is equipped with 6 electronic reading rooms, 5 faculty research rooms, and 10 self-study rooms, in addition to specialized spaces such as the First and Second Reading Rooms, the Foreign Language Book Lending Room, and the Local Literature Resources Room. All reading rooms, research rooms, and self-study rooms are equipped with air conditioning. There are over 5,000 seats for reading and self-study, 160 electronic reading terminals, 68 leisure seats, and 16 OPAC search machines.

The library operates with several specialized departments, including Reader Services, Technical Services, Information Consulting, and Resource Development. It maintains a large and diverse collection of professional resources related to the Computer Science and Technology programme. Specifically, there are 139,628 printed books in this discipline, including 134,452 Chinese books and 5,176 foreign language books, as well as 851 electronic journals.

The quantity and quality of library resources have been steadily increasing each year to meet the growing demands of teaching, research, and student learning. Over the past five years, the programme has invested a total of 1.2 million RMB in acquiring books and literature resources. This ongoing development of literature and database resources ensures sufficient support for the delivery of the programme and the professional development of both faculty and students.For the Chinese and foreign language databases in the library, please refer to **Appendix N (Appendix 03 Cooperation Agreement), Page 7**.

(2) Platforms of information resources on teaching management

The school has established a system of teaching management information to ensure the effective implementation of teaching activities. Through this system, various teaching service resources can be allocated, and students' entire learning process can be recorded. Students can use the platform to select courses, evaluate teaching quality, and check the results of course evaluation. Teachers can publish teaching plan, obtain student information, and manage exam scores on the platform.

For this programme, it also establishes a dissertation management platform, where teachers can publish thesis topics for their students to choose out of their interest. The platform allows for monitoring the quality of the students’ dissertation and manages the entire process from topic selection to thesis defense.

(3) Other information resources

The School has 300 computers distributed across teaching laboratories, primarily supporting theoretical instruction, practical training, course design, bachelor's thesis writing, and academic competitions. More than 200 sets of teaching and research software are available, including simulation tools such as MATLAB and Multisim, and development environments like Visual Studio and PyCharm. These resources fully support students' course learning, innovation and entrepreneurship activities, and participation in competitions, thereby enhancing their practical abilities, problem-solving skills, and overall academic competence.

3.3.3 Laboratories

The university has consistently prioritized the improvement of experimental and practical teaching conditions throughout its long-term development. Currently, it has established a comprehensive system of laboratories and training facilities, including one Basic Robotics and Virtual Simulation Training Room, one Industrial Robotics Application Laboratory, three Software Engineering and Technology Laboratories, three Big Data Management and Application Laboratories, two Embedded Systems Laboratories, three Network Perception and Application

Laboratories, three Student Innovation Laboratories, and two Electrical and Electronic Laboratories. These facilities form a robust experimental and training system that provides strong support for cultivation in the field of artificial intelligence. Additionally, the university has initiated the development of an Artificial Intelligence and Pharmaceutical Big Data Laboratory and plans to collaborate with leading AI enterprises such as iFLYTEK to establish laboratories focused on smart home and intelligent manufacturing in the coming years.

Within the College of Computer Science and Technology, a Practical Teaching Center has been established, covering an area of over 1,200 square meters and equipped with instruments valued at more than 15 million RMB. This center is dedicated to fostering students' innovation awareness and practical abilities by continuously advancing experimental technologies, developing integrated and design-oriented experiments, improving teaching methodologies, and opening laboratories to actively support faculty research and student participation in academic competitions.

Management structure

The staff members in the laboratories includes 1 director, 1 deputy director and 17 supervisors for instruction of experiments and internship. There is 1 with a senior technical title, 4 with associate senior technical titles, and 10 with intermediate or lower professional titles.

Safety management

To strengthen the education on students' safety and ensure the smooth progress of experiments, operation rules, laboratory safety policies, and other regulations are posted in the laboratories. In addition, relevant safety education is given to the students before practical teaching activities to ensure that experiments are conducted in a safe environment.

Equipment management

The laboratory staff always attach great importance to the management of instruments, equipment and devices. Efforts are made to improve the efficiency of equipment usage, extend the service life of instruments and equipment, reduce material consumption, prevent material damage, loss, accumulation and waste, and ensure the orderly conduct of experimental teaching and scientific research.

Maintenance and lending of equipment in the laboratories

The custodian is responsible for daily maintenance of the equipment in the laboratories, and is required to report the condition of the equipment once per semester.

The main laboratories for this programme include the Big Data Management and Application (Big Data) Laboratory, Big Data Management and Application (Cloud Computing) Laboratory, Big

Data Management and Application (Software Development) Laboratory, Network Perception and Application (Network Engineering) Laboratory, Software Engineering and Technology Laboratory, Industrial Internet Laboratory.

For more information about the specific laboratories, please refer to **Appendix N (Appendix 03 Cooperation Agreement), Page 6**. The detailed list of major equipment in the laboratories can be found in **Appendix P (Appendix 23 Others)**.

3.3.4 Research platforms

The College of Information Engineering received approval of the municipal-level "Internet + Smart Taizhou" discipline platform in 2015. The discipline of Computer Science and Technology has been designated as a key one at Taizhou University in 2016. The College of Information Engineering has several key laboratories and research centers, including Institute of Regional Informationization、 Institute of Network and Information Security、 Institute of Quantum Intelligent Computing。

There is currently one Jiangsu Provincial Experimental Teaching Demonstration Center for Computer Fundamentals, one Taizhou Industrial College of Intelligent Perception, and one Specialized, Refined, Unique, and Innovative Industrial College approved by the Ministry of Industry and Information Technology—the Industrial College of Security Sensing.

3.3.5 Teaching and office facilities

The main teaching facilities for this programme include academic buildings and practical teaching centers. The total floor area of the academic buildings in the school is 369,000 square meters, with 232 classrooms equipped with multimedia facilities. The facilities and lighting in the classrooms comply with the national standards and meet the requirements for various types of teaching, including classroom lectures and self-study for students. The Assets and Laboratory Management Office has set up multiple duty rooms in the academic buildings to manage, maintain, and repair the teaching facilities, ensuring their normal operation. In order to enhance the management of teaching facilities and utilize resources efficiently, multimedia is used for all classroom lectures.

The Department of Computer Science and Technology has three faculty office with a total area of 154.68 square meters. In addition, the college has three meeting rooms that can be available for hosting seminars and academic presentations for visiting scholars.

4. Transparency and Documentation

4.1 Module descriptions

Module descriptions for all compulsory and elective modules are accessible to all students and teaching staff and contain module tile, person responsible for each module, teaching method(s), credits and work load, intended learning outcomes, module content, admission and examination requirements, form(s) of exams and details explaining how the module mark is calculated, recommended literature, data of last amendment (see **Appendix D(Appendix 09 Module Descriptions)** and the webpage: https://jsj.tzu.edu.cn/ASIIN/list.htm).

4.2 Diploma and diploma supplement

The Sample diploma and diploma supplements can be found in **Appendix Q (Appendix 21 Graduation Certificates): Sample of diploma and Academic Transcript** and **Appendix R (Appendix 21 Graduation Certificates): Diploma Supplement.**

4.3 Relevant rules

Each year, when new students enroll, the school gives a handbook to each student. The student handbook contains documents outlining the rights and obligations of the students, ensuring that each student reads and understands the relevant policies. The chief of the programme, Computer Science and Technology, gives a lecture to all the new students on the orientation day, where they will know the historical development of the programme, the faculty, the laboratory conditions, and student development. It is a detailed introduction to the professional cultivation objectives, learning outcomes, and curriculum system.

Policies and documents related to the teaching quality and student management are open on the website of “Information Open” of Taizhou University (Please refer to the following website: https://xxgk.tzu.edu.cn/). For those teachers who have outstanding professional ethics and conduct, the school will reward them according to the "Moral Model Selection Measures in Taizhou University (Trial)" (**Appendix S (Appendix 02 Quality Management Handbook), Page 6-8**). However, for those who fail to meet the professional ethics, the school will impose punishments based on the "Approaches to Handling Misconduct of Teachers at Taizhou University" (**see Appendix S (Appendix 02 Quality Management Handbook), Page 9-14**). In order to ensure the implementation of these regulations, at the end of the school-based training for the new teachers, each of them must sign the "Teachers” Ethics and Conduct Commitment at Taizhou University". Every year, the school provides the new teachers with school-based training. In addition to explaining the relevant teaching documents, special emphasis is placed on reading to them the

"Opinions on Strengthening the Construction of Teachers" Ethics and Conduct at Taizhou University in the New Era" (**Appendix S (Appendix 02 Quality Management Handbook), Page 1-5**).

5. Quality Management: Quality Assessment and Development

5.1 Organisations of teaching quality management

The organization of teaching quality management consists of the President's Office, the Academic Affairs Committee, the Teaching Affairs Office, the Teaching Quality Management and Assessment Office, supervision teams of the university and the school. The President is responsible for overall teaching quality management, while the Vice President is in charge of the routine teaching. The Academic Affairs Committee guides the ideology, policies and systems related to teaching, and supervises all the schools' implementation of the undergraduate teaching quality standards, ensuring the normal and orderly conduct of quality monitoring. The Teaching Affairs Office is responsible for implementing the university's decisions on improving teaching quality, making and implementing the work plans for teaching and measures of quality monitoring, and making analysis on and improving teaching in a timely manner based on the feedback received from the teaching quality monitoring. The Teaching Quality Management and Assessment Office is responsible for monitoring, evaluating, diagnosing, and consulting on the educational quality and teaching management of the schools in the university. The schools are also responsible for teaching quality monitoring and evaluating respectively, ensuring the normal operation of the teaching quality monitoring and evaluation, and completing assigned tasks on time. The teaching supervision team of the university and the teaching supervision teams of all the schools diligently organize and carry out teaching quality monitoring and evaluation according to the deployment and requirements of the university and their respective schools. They give timely feedback to the relevant departments, units, teachers and other staff members on the problems discovered during the teaching quality monitoring, and submit monitoring reports on time.

5.2 Mechanism for teaching quality management

5.2.1 Mechanism for developing and revising the cultivation plan

A professional cultivation plan for undergraduates is the overall design and plan for implementation of the talent training in the university, providing the basis for organizing the teaching processes, arranging teaching tasks and conducting teaching quality monitoring and evaluation. **The university has formulated the "Taizhou College professional talent training quality evaluation management measures." and the "Guidelines of Taizhou University on revising the 2022 undergraduate program of talent training" (see Appendix F (Appendix 02**

Quality Management Handbook), Page 49-53 & Page 13-37). Regular revisions of the cultivation plan are carried out based on the national strategic needs as well as the requirements of the local economic and social development.

5.2.2 Mechanism for Teaching quality monitoring and evaluation

The university has established a series of teaching quality standards and process monitoring measures, including the "Implementation Measures for the Undergraduate Teaching Quality Assurance System at Taizhou University", the "Regulation on Teaching Supervision and Guidance of Taizhou University (Revision)" and the "Quality Standards for Key Teaching Processes of Taizhou University". Please refer to Appendix T (Appendix 02 Quality Management Handbook) for details.

According to the "Quality Standards of the Main Teaching Procedures at Taizhou University", the university comprehensively monitors the various aspects such as the cultivation, curriculum and syllabi, teaching preparation, theoretical course teaching, practical course teaching, internships (training), course design, examination and the bachelor's dissertation. The university has further formulated the "Quality Standards for Key Teaching Processes of Taizhou University" (**Appendix T (Appendix 02 Quality Management Handbook), Page 29-51**), establishing a comprehensive and multi-dimensional teaching quality evaluation system.

The university has also formulated the "Regulation on Teaching Supervision and Guidance of Taizhou University". It appoints supervisors to inspect, evaluate, consult and guide each stage of teaching. They evaluate the teaching process and provide suggestions or decision-making basis for the teaching and education of the whole university, thus promoting application of innovative teaching methods and improving teaching quality. Based on these regulations, the university and the school supervision teams have been established. The university-level teaching supervision team operates under the leadership of the Vice President in charge of teaching, with the Teaching Quality Management Office responsible for liaison, coordination, and service. The school-level teaching supervision team operates within the school under the Dean’s leadership. The teaching supervisors are required to know about the situation of the teachers’ fulfillment of teaching norms, moral education, and teaching tasks, including teaching preparation, classroom teaching, post-class tutoring, grading assignments, and exam marking. More importantly, those newly hired teachers, those part-time professional teachers and the teachers with lower ranking based on the student evaluation, should be under the supervision of the teams.

According to the "Implementation Measures for the Comprehensive Evaluation of Teaching Quality at Taizhou University", the university organizes school-level supervision teams to check

their own teaching quality management every semester. This includes the routine teaching inspections at three stages: the beginning of the semester, the mid-semester and the end of the semester, as well as random inspections during the semester. The teaching inspection at the beginning of the semester includes the preparation for the teaching tasks, teaching operation guarantees, teacher attendance and student enrollment. The mid-semester teaching inspection includes checks on the teaching operations, classroom teaching and practical teaching, reviews on the teaching plans, classroom observation records, examination papers, and assignment sampling. The teaching inspection at the end of the semester includes the completion of various teaching plans, graduation projects (theses), organization and management of terminal exams, teaching preparation for next semester and material archiving.

5.3 Mechanism for the teaching quality feedback and improvement

5.3.1 Mechanism for feedback of the teaching supervision teams

Each teaching supervisor is required to attend classes and find problems, and then communicate with the teacher after class, providing suggestions for improvement. Every teaching supervisor is also required to provide information feedback ever week. The supervision team holds meetings every two semesters to discuss the problems found in classroom teaching and produce a specific investigation report to provide feedback to the university leadership, all the schools and the functional departments. Each schools and functional departments carefully reading the investigation reports to identify relevant information for the improvement of future work.

5.3.2 Mechanism for feedback from students and teachers

Each semester, students evaluate the teaching results and effectiveness. The Teaching Quality Management and Assessment Office provides statistical data of student evaluation conducted at the end of the previous semester to each schools during the first week of the current semester. Based on the evaluation results, teachers can make timely improvements in their teaching. The relevant questionnaires can be found in Appendix U (Appendix 02 Quality Management Handbook). Additionally, the school collects teaching-related information through various channels such as the President's mailbox, QQ, WeChat, and other online platforms. These multi-channel approaches allow for the collection of various teaching information and the gathering of opinions and suggestions from teachers and students. The university and all the schools quickly respond to the problems raised by the teachers and the students, and their suggestions. They will also offer their solutions to those problems. They are committed to addressing all the problems, thus encouraging active participation from teachers, students and other related members.

In addition to the collection of feedback, sample analyses and representative results of the student and teacher surveys are compiled and reviewed each semester. These include statistical summaries of teaching evaluation scores and qualitative analyses of identified issues, together with corresponding improvement measures. Examples of such analyses and results are provided in **Appendix U (Appendix 02 Quality Management Handbook) and Appendix X(Appendix 22 Student Surveys and Results)**, illustrating how survey data are systematically evaluated and used for continuous quality improvement in teaching and learning.

5.4 Mechanism for external accreditation

The university has introduced an external evaluation system. **The programme of Computer Science and Technology underwent and passed comprehensive evaluation by the Jiangsu Provincial Higher Education Evaluation Office in 2022. Guided by the comprehensive evaluation, the programme has established a cultivation model that aligns with regional economic and social needs and employment prospects, focusing on the cultivation of applied talents.** The university vigorously promotes the spirit of Taizhou University, i.e., “rooting, specializing, daring to venture, and being good at innovation”, and the university also upholds the philosophy of "teacher-centered education and student-centered teaching", emphasizing teacher development and guidance services for students. This evaluation mechanism has played a significant role in improving the educational and teaching model, and cultivation mode of this programme.

ASIIN is an authoritative organization in the field of international accreditation for engineering, computer science, natural sciences, and mathematics in higher education. It provides high-level certification for degree programmes. ASIIN's accreditation process rigorously examines degree programmes from multiple perspectives, ensuring that accredited programmes offer excellent educational quality and cultivate graduates with solid professional knowledge and practical skills. Additionally, ASIIN collaborates closely with industries to ensure that degree programmes align with actual professional demands, enhancing students' employability. This close connection facilitates continuous updates of the curriculum, keeping it in sync with industry trends and technological development.

Checklist of Supporting Evidences

Nr.	Required Evidence	ASIIN Criteria	Check
1	(if available) **student handbook**, which summarizes the regulations and rules (e.g. examination regulations, admission regulations, learning outcomes, ...) for the study program to be accredited	All criteria	☑
2	**Quality management handbook** or other documents that summarize the university's quality management system	All criteria	☑
3	**Cooperation agreement** in the event of significant cooperation between the university and another university (e.g. double degree or joint degree) or a cooperation with a company in the degree programs to be accredited.	All criteria	☑
4	**University development plan** / strategic plan of the university	1.1	☑
5	Documents/other sources where programme-specific **objectives and learning outcomes** are written down and published, e.g. regulations, homepage, diploma supplement	1.1, 1.3	☑
6	Official document in which **official programme name** is indicated, e.g. Diploma Supplement, Transcript of Records, Student Handbook	1.2	☑
7	**Objective-module matrix** indicating how general outcomes are attained via individual modules (see Objectives-Module Matrix template)	1.3	☑
8	Current **study plan or curricular overview** (valid during time of on-site visit) in a table format that informs about the student workload (credit points and hours per module and per semester in local CP and ECTS) for each module in every semester (see example in the annex)	1.3	☑
9	**Module descriptions** for all compulsory and elective modules (see Module Description template). They must also be provided for final projects, compulsory internships and all modules taken at partner institutions as part of a mandatory double- or joint degree.	1.3, 4.1	☑
10	**Statistics on student mobility** of the study program to be accredited (incoming / outgoing) – use ASIIN Template	1.3, 1.4,	☑
11	Official **admission regulations**	1.4	☑

12	**Admission rate statistics** – use ASIIN Template	1.4	☑
13	Documents/other sources containing provisions for the **recognition of externally acquired academic qualifications**	1.4	☑
14	Documents/other sources on **workload verification** (indicating that student workload is corroborated by the institution, e.g. student surveys)	1.5	☑
15	Document describing the **conversion from credit points to ECTS credits**	1.5	☑
16	**Statistics on academic success** (first-year students, drop-outs, standard period of study) – use ASIIN Template	1.5	☑
17	**Examination regulations**	2	☑
18	**Statistics on grade distribution** and average grade – use ASIIN Template	1.5, 2, 6	☑
19	Academic and professional qualifications of all teaching staff involved in the programme (see **Staff Handbook** template). In case the programme includes a mandatory double- or joint degree option, qualifications must also be provided for the relevant teaching staff at the partner institutions.	3.1	☑
20	**HR Plan**	3.1	☑
21	**Graduation certificates** (Sample diploma or degree certificate; Sample diploma supplement)	4.2	☑
22	Sample **student surveys and results**	5	☑
23	Official documents where **rules for doctoral programmes** (admission, examination, PhD thesis, thesis defence, and thesis supervision) are anchored	All criteria	☑
24	Official documents that entail **principles for safeguarding good scientific practice**	All criteria	☑
25	**Statistics for PhD programmes** (average time for finishing the doctoral programme; time span between the completion of the doctoral thesis, the doctoral defence, and the publication of the thesis)	All criteria	☑
26	Documents that indicate **career support** (qualification programmes, guidance, and career support for early career researches)	1.1	☑

27	Documents that detail the **available resources** (laboratory handbooks, inventory lists, financial plans and documents that list the access to current scientific publications and books (license))	1.1, 1.3	☑
28	**Cooperation agreements and regulations** for internal and external cooperation	1.2	☑
29	Samples of some ongoing **PhD research projects**	1.3	☑
30	Sample of **published dissertations and papers** in scientific journals	1.3	☑
31	Representative selection of **graded exams/reports/ final projects** and other student work (10 exams/reports and 10 final projects per study programme)	2	☑
32	Video and image material showing the **university's facilities**, especially the laboratories	3.2	☑
